

Water Conservation Techniques in Traditional Human Settlements

Water Conservation Techniques in Traditional Settlements highlights the value of traditional knowledge of pre-industrial societies in the area of natural resources management. An emphasis is placed on the history of water management traditional techniques and local knowledge considered as part of cultural history. The author reviews the evolution of these practices since the Palaeolithic era by examining various societies developed ingenious water techniques in different parts of the world. Special attention is given to the creation of water and the management practices developed in the arid areas and notably to the Oases model described as a sustainable development alternative to the hydraulic civilisations model based on an abusive exploitation of water resources. The study of traditional knowledge is described as a contribution to developing a new water management paradigm more in line with the sustainable development approach and integration of technical, ethical and aesthetic aspects. Several examples of innovative use of ancient water management practices for agricultural, architectural and urban development purposes are described. The book with numerous photos, drawings and sketches is a useful guide for designing sustainable solutions to combat desertification and to protect the landscape and the ecosystems.
