

## Organ Histology: A Students Guide

This book is a concise but comprehensive text for review and self evaluation in the study of the microscopic anatomy of the major organ systems of the body. It aims to meet the requirements of students of medicine, dentistry, histopathology, mammalian biology and the paramedical sciences. The subjects have been chosen to complement a programme of physiology and dissection or prosection. Basic concepts of cell and tissue biology are presently considered in separate prerequisite units integrated with biochemistry and genetics and are not included in this text. The approach has been to focus on unique features or diagnostic differences between cells, their function and organization into organs rather than on pure morphologic description. Developmental aspects of certain organs have been described where these contribute to understanding functional relationships between cells in organ systems. A uniform text structure (point form) helps the reader to organize, review and retain pertinent information. A summary precedes each chapter which helps to focus on core concepts. Each topic is also prefaced by a list of objectives which serve as a guide for review. In addition, a list of key words (bold in the text), phrases and concepts should be defined as a result of reading the text. The terminology follows that in contemporary use giving alternative names according to nomina histologica where possible. A series of plates illustrates in line drawings the major features of cells in organs based on electron micrographs. In addition, tables show functional relationship between cells or their products.
