

THE NATURE OF WAYFINDING IN THE CITY: A CASE STUDY OF WAIKIKI

In order to have a firm conceptual basis of wayfinding there needs to be a historical understanding, through the tracking of different modes in wayfinding from the first known account of this awareness to contemporary notions. These modes of perception and movement need to be addressed from their earliest conception, from the labyrinths of Greek mythology to the digital interfaces that inhabit users internal and external surroundings. Navigation of the seas by the indigenous people of Hawaii to the situationists in mapping the city as an intuitive experiment of discovery and encounter, the significance of cartography will be a topic that will be investigated and seen through the evidence of brochures, surveys, and maps collected in Waikiki to further the investigation of how the tourist or traveler finds their point of desire in the spatial matrix. The system of wayfinding can be analyzed by means of a qualitative approach on a micro scale in the city context by observation and a systematic approach. This entails photographing and mapping the everyday movements of the visitors. The users ability to traverse the urban fabric of the city with the tools of wayfinding as well as the physical cues that inform ones experience is crucial. These modes of traversing can be virtual, visceral, tactile or phenomenological that influences the users experience of the spaces. Yet, on the macro scale, the city system of find-ability can be analyzed through a qualitative lens, allowing the comparative study of multiple cities to see the dynamics and interfaces that orient the user. Nevertheless, the user engages the instances or points along the way, in order, to get where they want to be. The notion of finding in the city context is a crucial aspect in which people have to address on a daily basis. Humans already have an inherent ability to direct themselves through space with their movement and

intuition; this makes us spatial beings that are intertwined within our surroundings. We rely on so many visual cues from the environment in which we find ourselves, for the orientation towards a specific destination or goal. Indeed, there are many ways to access information for finding purposes through these mediums; digital interfaces are expanding the ways of communication, even through physical interfaces of the city. These interfaces allow the user many options but at the same time can be disorienting and anxiety filled; for instance, if one is unaware of the technology and its applications for the users ability to navigate the terrain. The spaces humans inhabit are being transformed by technology and the ways in which we interact physically and digitally in the urban context. This study of wayfindings role in the context of the urban landscape allows one to understand how and why it is changing the ways in which users inhabit space, or how they see themselves traversing to specific points or destinations, either through mechanical means, such as trains, buses, automobile, and helicopter or bodily means of travel, such as walking and riding a bicycle. Each mode of traversing enables the user in the urban fabric a way of finding destinations and points of interest, even while using a digital interface or a signage system in the landscape. These ways of mapping allow and aid the user in finding what he or she is searching for in the city. These means are evolving and transforming; that is, global positioning as well as hand-held devices implementing these tasks is influencing these modes of travel. Indeed, the citys relationship to the user is becoming more complex and threaded through our daily routines with technology and human intervention being the source.
