

# HYDROXYZINE (Hydrochloride): Treats Anxiety, Nausea, Vomiting, Allergies, Skin Rash, Hives, Itching, and Alcohol Withdrawal Symptoms

Although, your health condition may impact your everyday life, do not let it define who you are. Hydroxyzine is used for symptomatic relief of anxiety and tension associated with psychoneurosis and as an adjunct in organic disease states in which anxiety is manifested. It is useful in the management of pruritus due to allergic conditions such as chronic urticaria and atopic and contact dermatoses and in histamine-mediated pruritus. As a sedative when used as a premedication and following general anesthesia, hydroxyzine may potentiate meperidine and barbiturates, so their use in pre-anesthetic adjunctive therapy should be modified on an individual basis. Atropine and other belladonna alkaloids are not affected by the drug. Hydroxyzine is not known to interfere with the action of digitalis in any way and it may be used concurrently with this agent. The effectiveness of hydroxyzine as an antianxiety agent for long term use, that is more than 4 months, has not been assessed by systematic clinical studies. The physician should reassess periodically the usefulness of the drug for the individual patient. Thanks and may you have a good understanding about this drugHydroxyzine. You may want to share this book with your family and friends who may be in need of help and would want to use this medicine. Take care, and as always, be well!
