

PROZAC (Fluoxetine): Treats Depression, Obsessive-Compulsive Disorder (OCD), Bulimia Nervosa (Eating Disorder), Premenstrual Dysphoric Disorder ... Alcoholism, ADHD, Sleep Disorder, Etc

“Although, your health condition may impact your everyday life, do not let it define who you are.” PROZAC (Fluoxetine) is used to treat depression, obsessive-compulsive disorder (bothersome thoughts that won't go away and the need to perform certain actions over and over), some eating disorders, and panic attacks (sudden, unexpected attacks of extreme fear and worry about these attacks). Fluoxetine (Sarafem) is used to relieve the symptoms of premenstrual dysphoric disorder, including mood swings, irritability, bloating, and breast tenderness. Fluoxetine is in a class of medications called selective serotonin reuptake inhibitors (SSRIs). It works by increasing the amount of serotonin, a natural substance in the brain that helps maintain mental balance. Fluoxetine is also sometimes used to treat alcoholism, attention-deficit disorder, borderline personality disorder, sleep disorders, headaches, mental illness, posttraumatic stress disorder, Tourette's syndrome, obesity, sexual problems, and phobias. Talk to your doctor about the possible risks of using this medication for your condition. This medication may be prescribed for other uses; ask your doctor or pharmacist for more information. Thanks and may you have a good understanding about this drug—PROZAC (Fluoxetine). You may want to share this book with your family and friends who may be in need of help and would want to use this medicine. Take care, and as always, be well!
